Medical Imaging Systems

Figure 12.1
Scanning lines and round objects (a) Each object represents 1 pixel, but each cycle of output signal represents 2 pixels, (b) For 2n scanning lines, n vertical objects are required, (c) If objects are located between scanning lines, 2n lines are insufficient, (d) For adequate resolution, 2n(1.4) lines are required.

Horizontal scan line	Objects		
Output signal			
(a)	(b)	(c)	(d)
Vertical objects	n	n	n
Scanning lines	2n	2n	2n√2

$$N = A \left(\frac{7.2}{d(C - 0.05)} \right)^2$$

Figure 12.2 In each successive gamma-camera picture of a thyroid phantom, the number of counts is increased by a factor of 2. The number of counts ranges from 1536 to 800,000. The Polaroid camera aperture was reduced to avoid overexposure as the number of counts was increased.

For the Poisson probability density distribution, calculate $p(K;m)$ for $K = 0, 1, 2, 3, 4, 5$ and $m = 3$.

$$p(K; m) = \frac{e^{-m} m^k}{K!}$$

K	m	P(k; m)
0	3	0.049787
1	3	0.149361
2	3	0.224042
3	3	0.224042
4	3	0.168031
5	3	0.100819

Figure 12.3
Modulation transfer function $S(f)$ for a typical x-ray system $S(f)$ is squared and integrated to yield N_e , the noise-equivalent bandwidth. The limiting resolution, 4 cycles/mm, is indicated at the 0.05 contrast level. The abscissa is plotted in cycles per millimeter, which is the same as line pairs per millimeter.

$$N_e = \int_0^{\infty} S^2(f) df$$

$$S(f) = \frac{\pi}{4} \left[M(f) + \frac{M(3f)}{3} + \frac{M(5f)}{5} + \frac{M(7f)}{7} + \dots \right]$$

$$\frac{1}{N_e} = \left[\left(\frac{1}{N_{e1}} \right)^2 + \left(\frac{1}{N_{e2}} \right)^2 + \dots \right]^{1/2}$$

Figure 12.4 The vidicon has a cathode and a series of grids to form, shape, and control an electron beam. Magnetic deflection (not shown) scans the beam over the target, which is mounted on the interior of the glass face plate. From the target, light-modulated signal current flows through the load resistor and is amplified.

Figure 12.5 The x-ray tube generates x rays that are restricted by the aperture in the collimator. The Al filter removes low-energy x rays that would not penetrate the body. Scattered secondary radiation is trapped by the grid, whereas primary radiation strikes the screen phosphor. The resulting light exposes the film.

Figure 12.6 The lowest-energy x rays are absorbed in the anode metal and the tube glass envelope. An Al filter further reduces the low-energy x rays that do not pass through the body and would just increase the patient dose. Only the highest-energy x rays are capable of penetrating the body and contributing to the film darkening required for a picture. Note that the average energy increases with the amount of filtration.

Figure 12.7 In the image intensifier, x rays strike the input phosphor screen, thus generating light. Light stimulates the photocathode to emit electrons, which are accelerated through 25 kV to strike the output phosphor screen. Brightness gain is due to both geometric gain and electronic gain.

Figure 12.8 Table-top Computed Radiography Cassette Scanner. The screen is removed from the cassette, scanned, erased and returned to the cassette for the next exposure. The image information is sent to a computer for display and analysis. Photo courtesy of iCRCo.

Figure 12.11 Basic coordinates and geometry for computed tomography. The projection rays shown represent those measured at some angle θ . The source and detector pair are rotated together through a small angle, and a new set of rays measured. The process is repeated through a total angle of 180°. (From R. A. Brooks and G. Di Chiro, "Theory of image reconstruction in computed tomography." *Radiology*, 1975, 117, 561-572.)

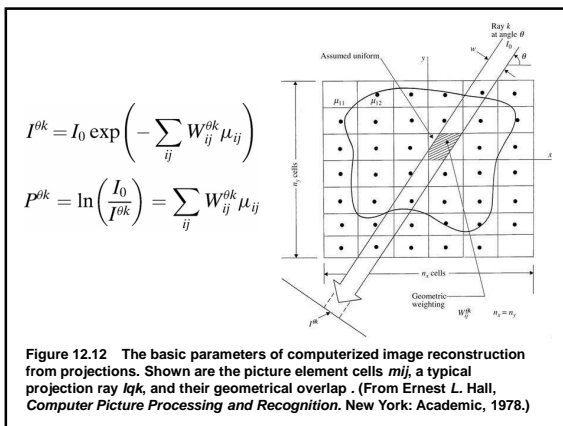

Figure 12.12 The basic parameters of computerized image reconstruction from projections. Shown are the picture element cells m, j , a typical projection ray lqk , and their geometrical overlap. (From Ernest L. Hall, *Computer Picture Processing and Recognition*. New York: Academic, 1978.)

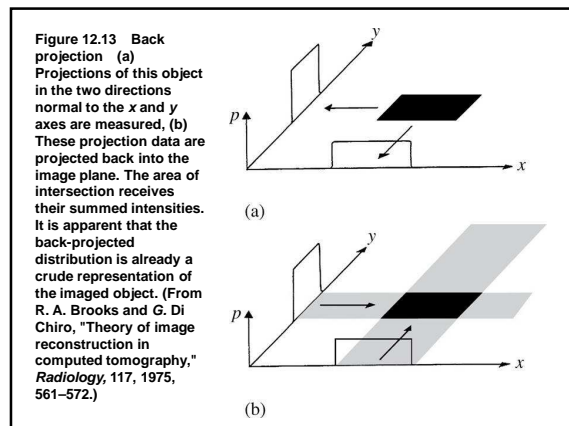

Figure 12.13 Back projection (a) Projections of this object in the two directions normal to the x and y axes are measured, (b) These projection data are projected back into the image plane. The area of intersection receives their summed intensities. It is apparent that the back-projected distribution is already a crude representation of the imaged object. (From R. A. Brooks and G. Di Chiro, "Theory of image reconstruction in computed tomography," *Radiology*, 117, 1975, 561-572.)

The sums of the projection data for x and y are equal, as shown in Fig. 12.13(a). The sum of the projection data (1.0 or 0) is divided evenly over each block (1/3 or 0) for x and y and the results added to yield the backprojection shown.

0	1/3	0
1/3	2/3	1/3
0	1/3	0

Table 12.1 Nuclear Magnetic Resonance Frequencies of Common Biological Elements

Element	Percent of Body Weight	Isotope	Relative Sensitivity	NMR Frequency, MHz/T
Hydrogen	10	^1H	1.0	42.57
Carbon	18	^{13}C	1.6×10^{-2}	10.70
Nitrogen	3.4	^{14}N	1.0×10^{-3}	3.08
Sodium	0.18	^{23}Na	9.3×10^{-2}	11.26
Phosphorous	1.2	^{31}P	6.6×10^{-2}	17.24

Table 12.1

Figure 12.18 MRI image of the head. Sets of images may be acquired for 1 mm section thickness at 2 mm apart for diagnosis of the entire volume of the brain. Photo courtesy of Siemens Medical.

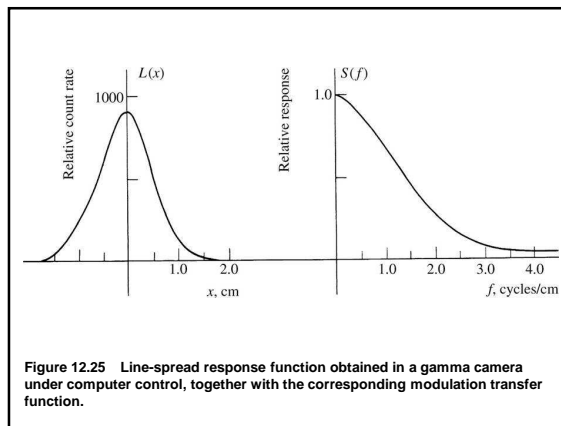

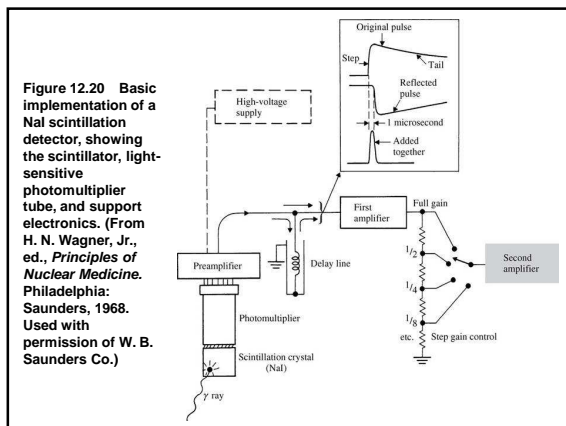

Figure 12.19 MRI image of the brain. Compare to Figure 12.15. The MRI image shows differences due to hydrogen concentration rather than tissue density making the bony part of the skull transparent and having a different contrast pattern than the CT image. Image courtesy of Siemens Medical Systems.

Table 12.2 Characteristics of Five Isotopes for PET

Isotope	Maximal Kinetic Energy	Half-life	Broadening
¹⁰ F	640 keV	110 min	1.1 mm
¹¹ C	960 keV	20.4 min	1.9 mm
¹³ N	1.2 MeV	10.0 min	3.0 mm
⁶⁰ Ga	1.9 MeV	62.3 min	5.9 mm
⁸² Rb	3.4 MeV	1.3 min	13.2 mm

Table 12.2

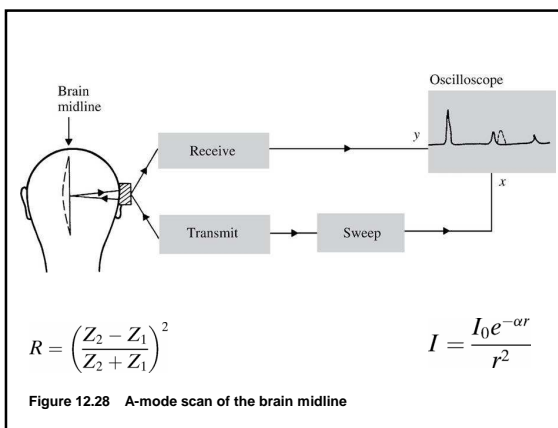

Table 12.3 Acoustic Properties of Some Tissues at 1.0 MHz

Tissue	<i>u</i> , m/s	<i>Z</i> , g/(cm ² ·s)	HVL, cm	<i>R</i> at Interface
Water	1496	1.49 × 10 ⁵	4100	Air/water 0.999
Fat	1476	1.37 × 10 ⁵	3.8	Water/fat 0.042
Muscle	1568	1.66 × 10 ⁵	2.5	Water/muscle 0.054
Brain	1521	1.58 × 10 ⁵	2.5	Water/brain 0.029
Bone	3360	6.20 × 10 ⁵	0.23	Water/bone 0.614
Air	331	4.13	1.1	Tissue/air 0.999
