P1: (15 P)

A RSA cryptosystem with two users A and B having the following secret prime number pairs: for user A: 53 and 17 and for user B: 41 and 19

- Find out the adequate public key of user A from the following list of integers: [35, 26, 48] giving the reason for your choice. Compute the corresponding secret key of user A.
- Find out the adequate public key of user B from the following list of integers: [125, 1024, 31] giving the reason for your choice. Compute the corresponding secret key of user B.
- How many public keys are possible for each user?
- User A encrypts the message $M=9$, and send the resulting cryptogram Y_{AB} to B. User A then signs the cryptogram Y_{AB} and generates the signature S_{AB} . Compute Y_{AB} and S_{AB} .
- Decipher the cryptogram Y_{AB} on user **B's** site and verify the Signature S_{AB} .
- User B signs the received message M and sends his signature S_{BA} back to A. Compute the signature S_{BA} .

Page 3

3

Solution:

- Find out the adequate public key of user A from the following list of integers: [35, 26, 48] giving the reason for your choice. Compute the corresponding secret key of user A.
 $N_A = 53 \times 17 = 901$, $\phi(N_A) = (53-1)(17-1) = 832$
 $\gcd[E_A, \phi(N_A)] = 1 \Rightarrow$ select 35 as $\gcd(832, 35) = 1$
 $E_A = 35$
 $D_A = -309 \bmod 832 = 523$ (see computation below)

m	a1	a2	b1	b2	q	r	INVERSE VALUE	GCD
832	35	1	0	0	1	253		
35	253	0	1	1	-23	1	8	
27	8	1	-1	-23	24	3	3	
8	3	1	4	23	-95	2	2	
3	2	4	-9	-95	214	1	1	
2	1	-9	13	214	-309	2	0	INVERSE: -309 GCD: 1
- Find out the adequate public key of user B from the following list of integers: [125, 1024, 31] giving the reason for your choice. Compute the corresponding secret key of user B.
 $N_B = 41 \times 19 = 779$, $\phi(N_B) = (41-1)(19-1) = 720$
 $\gcd[E_B, \phi(N_B)] = 1 \Rightarrow$ select 31 as $\gcd(720, 31) = 1$
 $D_B = 31^{-1} \bmod 720 = -209 + 720 = 511$

m	a1	a2	b1	b2	q	r	INVERSE VALUE	GCD
720	31	1	0	0	1	23	7	
31	7	0	1	1	-23	4	3	
7	3	1	-23	93	2	1	1	
3	1	-4	0	93	-209	3	0	INVERSE: -209 GCD: 1
- How many public keys are possible for each user?
 # of keys for user A = $\phi(N_A) = \phi(832) = \phi(2^6 \cdot 13) = 832(1-1/2)(1-1/13) = 384$ keys
 # of keys for user B = $\phi(N_B) = \phi(720) = \phi(2^4 \cdot 3^2 \cdot 5) = 720(1-1/2)(1-1/3)(1-1/5) = 192$ keys

Page 4

4

- User A encrypts the message $M=9$, and send the resulting cryptogram Y_{AB} to B. User A then signs the cryptogram Y_{AB} and generates the signature S_{AB} . Compute Y_{AB} and S_{AB} .
 $Y_{AB} = (M)^{E_A} \bmod N_A$
 $Y_{AB} = (9)^{35} \bmod 901 = 196$
 $S_{AB} = (Y_{AB})^{D_A} \bmod N_A$
 $S_{AB} = (196)^{523} \bmod 901 = 780$
- Decipher the cryptogram Y_{AB} on user B's site and verify the Signature S_{AB} .
Decryption:
 $M = (Y_{AB})^{D_B} \bmod N_B$
 $M = (9)^{31} \bmod 779 = 9$
Verification:
 $(S_{AB})^{E_A} \bmod N_A = Y_{AB} \bmod N_A$
 $(780)^{35} \bmod 901 = \dots = 196 = Y_{AB}$
 \Rightarrow **signature is authentic!**
- User B signs the received message M and sends his signature S_{BA} back to A. Compute the signature S_{BA} .
 $S_{BA} = (M)^{E_B} \bmod N_B$
 $S_{BA} = (9)^{31} \bmod 779 = 688$

P2: (9 P)

(b) A block cipher with a key length of 256 bits is encrypting a clear text with a block size of 1000 bit having a clear text entropy of 900 bits.

- Compute the unicity distance of the cipher n_u
- Compute the new unicity distance of the cipher if 500 random bits are appended to each clear text block
- Is the cipher theoretically breakable after this modification if the attacker can observe 2700 cipher text bits? Why?

Solution:
 $K = 256$ Bits, $H(x) = 900$ Bits, $N = 1000$ Bits, $r = ?$

- Unicity distance $n_u = K/r$
 As $r = \lceil (N - H(x)) / N \rceil$
 $\Rightarrow r = (1000 - 900) / 1000 = 0.1 \Rightarrow n_u = K/r = 256/0.1 = 2560$ Bits
- $n'_u = \lceil ((L + N) / N) \rceil \cdot n_u$
 $n'_u = \lceil (500 + 1000) / 1000 \rceil \cdot 2560$
 $n'_u = 3840$ Bits
- The number of observed cipher text bits is only 2700 bits and is **less** than the unicity distance (3840 bits). Therefore, the cipher is theoretically **not** possible to break

P3: Compute the multiplicative inverse of $(011000000)_2$ modulo $P(x) = (110110001)_2$ and verify your result (7 P)

Solution:

Extended gcd Algorithm:

$P_1(x)$	$P_2(x)$	$B1(x)$	$B2(x)$	$Q(x)$	$R(x)$
$x^7 + x^6 + x^5 + x^4 + 1$	$x^7 + x^6$	0	1	x	$x^5 + x^4 + 1$
$x^7 + x^6$	$x^7 + x^6 + x^5 + x^4 + 1$	1	x	x^2	x^2
$x^5 + x^4 + 1$	$x^7 + x^6 + x^5 + x^4 + 1$	$x^2 + 1$	$x^2 + 1$	$x^3 + 1$	1
x^2	1	$x^2 + 1$	$x^2 + x^2 + x^2 + x^2$	x^2	0

Verification:

$(x^5 + x^4 + 1)(x^2 + x^2 + x^2 + x^2) = (x^7 + x^6 + x^5 + x^4 + 1) \cdot (x^2 + x^2 + x^2 + x^2)$
 $= (x^{12} + x^{11} + x^{10} + x^9 + x^8 + x^7 + x^6 + x^5 + x^4 + x^3 + x^2 + x + 1)$
 $\equiv 1 \pmod{x^7 + x^6 + x^5 + x^4 + 1}$

$x^5 = x^7 + x^6 + x^5 + x^4 + 1$
 $x^6 = x^7 + x^6 + x^5 + x^4 + x = x^7 + x^6 + x^5 + x^4 + 1 + x^2 + x^2 + x$
 $= x^7 + x^6 + x^5 + x^4 + 1 + x^2 + x^2 + x$
 $x^7 = x^7 + x^6 + x^5 + x^4 + x^3 + x^2 + x + 1 = x^7 + x^6 + x^5 + x^4 + 1 + x^2 + x^2 + x$
 $x^8 = x^7 + x^6 + x^5 + x^4 + x^3 + x^2 + x + x^2 = x^7 + x^6 + x^5 + x^4 + 1 + x^2 + x^2 + x + x^2$
 $x^9 = x^7 + x^6 + x^5 + x^4 + x^3 + x^2 + x + x^2 + x^2 = x^7 + x^6 + x^5 + x^4 + 1 + x^2 + x^2 + x + x^2$
 $x^{10} = x^7 + x^6 + x^5 + x^4 + x^3 + x^2 + x + x^2 + x^2 + x^2 = x^7 + x^6 + x^5 + x^4 + 1 + x^2 + x^2 + x + x^2$
 $x^{11} = x^7 + x^6 + x^5 + x^4 + x^3 + x^2 + x + x^2 + x^2 + x^2 + x^2 = x^7 + x^6 + x^5 + x^4 + 1 + x^2 + x^2 + x + x^2$
 $x^{12} = x^7 + x^6 + x^5 + x^4 + x^3 + x^2 + x + x^2 + x^2 + x^2 + x^2 + x^2 = x^7 + x^6 + x^5 + x^4 + 1 + x^2 + x^2 + x + x^2$

P4: A Diffie-Hellman (DH) public key exchange system uses $GF(2^6)$ deploying the irreducible polynomial $p(x) = x^6 + x^3 + 1$. (21 P)

- For $\beta = x$, compute β^i for $i = 1$ to 10. What is the multiplicative order of x ? (2)
- Which multiplicative orders are possible for elements in $GF(2^6)$? (2)
- Prove that the element $\delta = 1 + x + 000011$ is a primitive element. (4)
- Compute the multiplicative order of δ^{14} . (2)
- Use the element δ as a public element in the above $GF(2^6)$ and compute the DH public keys Y_a and Y_b and the shared secret key Z_{ab} for users A and B having the secret keys $X_a = 42$ und $X_b = 14$. compute the binary vectors for Y_a and Y_b and Z_{ab} by making use of the following: $\delta^7 = x^5 + x^2$, $\delta^{21} = 1 + x^3$. (6)
- What is the probability of getting an element with order 21 if the element is picked up randomly from $GF(2^6)$? (2)
- For any element α from $GF(2^6)$, compute t for which $\alpha^{-1} = \alpha^t$. Compute then $x^{-1} \pmod{p(x)}$ using that result. (Hint make use of the results in 1) Verify your result. (3)

Page 8

8

Solution:

- For $\beta = x$, compute β^i for $i = 1$ to 10. What is the multiplicative order of x ?
 $P(x) = x^6 + x^3 + 1 = 0 \Rightarrow x^6 = x^3 + 1$
 $x^1 = x$
 $x^2 = x^2$
 $x^3 = x^3$
 $x^4 = x^4$
 $x^5 = x^5$
 $x^6 = x^3 + 1$
 $x^7 = x^4 + x$
 $x^8 = x^5 + x^2$
 $x^9 = x^6 + x^3 = x^3 + x^3 + 1 = 1$
 $x^{10} = x$
 $\text{ord}(x) = 9$
- Which multiplicative orders are possible for elements in $GF(2^6)$?
 Possible orders are the divisors of $2^6 - 1 = 63$
 Divisors of 63 are: 1, 3, 7, 9, 21 and 63
- Prove that the element $\delta = 1 + x + 000011$ is a primitive element.

 $(x-1)^{362} = (x-1)^{362}</$

Solution:

1. Prove that N is a prime according to Pocklington's Theorem.
 $N = R \cdot F + 1 = 2 \cdot 281 + 1 = 563$, F = 281 is a prime, and R = 2. Is N=563 a prime? (1)
 Choose $a=2$.
Proof: 1. $\gcd(a^{(N-1)/R} - 1, N) = \gcd(2^{(563-1)/2} - 1, 563) = \gcd(2^{281} - 1, 563) = \gcd(3, 563) = 1$ is true
 2. $a^{N-1} \equiv 1 \pmod{N} \Leftrightarrow 2^{562} \equiv 1 \pmod{563}$ is true
 3. $F > \sqrt{N}$
 $281 > \sqrt{563} \approx 23.7 \Rightarrow 281 > 23.7$ is true
 As all conditions 1, 2 and 3 are all true \Rightarrow 563 is for sure a prime number

2. Find a primitive element in GF(563) and use it as a public element in ElGamal public key system (show all necessary computations).
 Possible orders are the divisors of $(563 - 1) = 562$
 Divisors of 562 are: 1, 2, 281 and 562 as can be seen from (1)

Checking if the element 2 is primitive
 $2^1 \pmod{563} \neq 1$,
 $2^2 \pmod{563} \neq 1$,
 $2^{281} \pmod{563} = 562 \neq 1$
 $\Rightarrow \text{Ord}(2) = 562 \Rightarrow a = 2$ is primitive element

Page 13

13

3. User A encrypts the message M=33 and send it to user B who has the secret key $X_B = 70$ by using the random number R=17. Compute B's public key Y_B and the encrypted message C_e and r.

Encryption:

User B:
 $X_B = 70$
 $Y_B = \alpha^{X_B} \pmod{p} = 2^{70} \pmod{563} = 445$

Public directory:
 $\alpha = 2, \text{GF}(563)$
 $Y_B = 2^{70} \pmod{563} = 445$

User A:
 $M = 33$

$r = \alpha^R = 2^{17} \pmod{563} = 456$
 $C_e = M \cdot Y_B^R = 33 \cdot (2^{17})^{17} \pmod{563} = 33 \cdot 63 = 390$

4. Decrypt the cryptogram C_e on the receiver side B showing all necessary computations, therefore.

Decryption:

$Z^1 = (\alpha^R)^{-X_B} = r^{-X_B} = 456^{-70} \pmod{563} = 456^{-70 \pmod{562}} \pmod{563} = 456^{(562-70)} \pmod{563} = 143$
 $M = C_e \cdot Z^1 = 390 \cdot 143 \pmod{563} = 33$

Page 14

14

5. Let user A having the secret key $X_A = 133$ compute his Signature S_A according to ElGamal signature scheme shown below for the same message M=33. Select one adequate k from the following list (k = 22,270,89).

User A signs M
 $X_A = \text{Secret Key of A}$
 $\alpha^{X_A} = Y_A$
 $Y_A = \text{public key of A}$

Verifier
 p, α, Y_A
 $\alpha^M = Y_A^r \cdot r^S \pmod{N}$
 Then M is authentic

Signed Message S_A
 M
 $k^{-1} \cdot (M - r \cdot X_A) \pmod{(N-1)} = S$
 $\alpha^k = r$

k Random unit in Z_{N-1}

K has to be invertible mod N-1, N-1=562
 $\gcd(k, N-1) = 1 \Rightarrow$ select 89 from the list (k = 22,270,89). As $\gcd(562, 89) = 1$
 $K = 89, 89^{-1} = -221 \pmod{562} = 341$ (see table below)
 $r = \alpha^k = 2^{89} \pmod{563} = 397$
 $S = k^{-1} \cdot (M - r \cdot X_A) \pmod{(N-1)}$
 $= 89^{-1} \cdot (33 - 397 \cdot 133) \pmod{562}$
 $= 341 \cdot (33 - 52801) \pmod{562}$
 $= 341 \cdot (-52768) \pmod{562}$
 $S = -17993888 \pmod{562} = -334 + 562 = 228$

P6: (11 P)
 A Massey-Omura lock for Shamir's 3-Pass Protocol over GF(2⁸) using the irreducible polynomial $p(x) = x^8 + x^7 + x^3 + x + 1$ as a field modulus is set up.
 (Hint: $2^8 - 1 = 3 \cdot 5 \cdot 17$)

1. Write $p(x)$ in binary form and find out the multiplicative order of x (by using the list of binary irreducible polynomials). [1.5]

2. Compute the powers of x in GF(2⁸) (x^8 and x^{10}). [1.5]

3. The secret key for users A and B are 7 and 13 respectively. A message $M = x^8$ is sent from A to B. Compute all the exchanged 3-pass messages as powers of x with smallest possible power of x. [2]

4. Compute the number of possible secret keys in case that the sent clear text message M was only selected as a power of x. (that is $M=x^i$ for some i). [3]

5. What is the maximum number of exponentiation search cycles required to break a message of the form (M=xⁱ)? Why? [3]

Page 16

16

Solution:

1. Write $p(x)$ in binary form and find out the multiplicative order of x (by using the list of binary irreducible polynomials).
 The polynomial binary pattern is: $p(x) = x^8 + x^7 + x^3 + x + 1 = 110001011$
 e of $p(x)$ is 85 (see list of irreducible polynomials in the lecture slides)
 \rightarrow order of x modulo $p(x)$ is 85.
 $\rightarrow x^{85} = 1$

2. Compute the powers of x in GF(2⁸) (x^8 and x^{10}).
 $p(x) = x^8 + x^7 + x^3 + x + 1 = 0$
 $\Rightarrow x^8 = x^7 + x^3 + x + 1$
 $x^9 = x^8 + x^7 + x^3 + x + 1 = (x^7 + x^3 + x + 1) + x^7 + x^3 + x + 1 = x^7 + x^3 + 1 + x^7 + x^3 + x^2 + x + 1 = x^2 + x^3 + x^2 + x + 1 = (x^2 + x^3 + x^2 + x + 1) + x^2 + x^3 + x^2 + x + 1 = x^7 + 1 + x^2 + x^3$

m	a1	a2	b1	b2	a	r	INVERSE VALUE =	GCD
255	7	1	0	0	1	4	3	
7	3	0	1	1	-38	2	5	
3	1	1	-38	73	19			1

Page 17

17

3. The secret key for users A and B are 7 and 13 respectively. A message $M = x^8$ is sent from A to B. Compute all the exchanged 3-pass messages as powers of x with smallest possible power of x.

A
 $E_A = 7$ as $\gcd(2^8-1, 7) = 1$
 $D_A = E_A^{-1} \pmod{2^8-1}$
 $D_A = 7^{-1} \pmod{255} = 73$

B
 $E_B = 13$ as $\gcd(2^8-1, 13) = 1$
 $D_B = E_B^{-1} \pmod{2^8-1}$
 $D_B = 13^{-1} \pmod{255} = -98 = -98 + 255 = 157$

As the order of x is 85, the modulus in the exponents of x is 85!!!

$M = x^8$
 $Y_1 = M^{E_A} = x^{8 \cdot 7} = x^{56}$
 $Y_2 = (Y_1)^{E_B} = x^{56 \cdot 13} = x^{728} = x^{728 \pmod{85}} = x^{19}$
 $Y_3 = (Y_2)^{D_A} = M^{E_A \cdot D_A} = x^{8 \cdot 7 \cdot 73} = x^{406} = x^{406 \pmod{85}} = x^{19}$
 $M = (Y_3)^{D_B} = M^{E_A \cdot D_A \cdot D_B} = x^{8 \cdot 7 \cdot 73 \cdot 157} = x^{8 \cdot 7 \cdot 11481} = x^{8 \cdot 126252} = x^8$

m	a1	a2	b1	b2	a	r	INVERSE VALUE =	GCD
255	13	1	0	0	1	25	4	
13	1	0	1	1	-251	2	5	
1	1	-251	251	251	1001	1	2	
1	1	1	1	1	1	1	1	

Page 18

18

4. Compute the number of possible secret keys in case that the sent clear text message M was only selected as a power of x . (that is $M=x^i$ for some i).

If the attacker knows that the sent messages are powers of x , then the modulus in the exponent is 85 (85 is the order of x). The number of distinct messages is then only 85

The cryptographically significant keys are those usable for 85 as a modulus instead of 255.

The usable keys are those which are invertible modulo 85.

The number of such keys is $\varphi(85) = \varphi(5 \times 17) = (5-1)(17-1) = 4 \times 16 = 64$ keys.

5. What is the maximum number of exponentiation search cycles required to break a message of the form $(M=x^i)$? Why?

As the maximum number of search cycles to compute the discrete logarithm is the maximum order involved in the terms to be attacked. The attacked term in that case is x^i .

The order of any element having the form (x^i) for any i is $= 85/\text{gcd}(85,i)$. The maximum value for the order is for i such that $\text{gcd}(85,i) = 1$. That is the maximum order is 85 and the maximum number of simple search cycles to get the discrete logarithm is 85.

Breaking a system is reached if the secret key could be found for one encrypted message as Y_1 in this example.
